

# Configure S3 Bucket

1. Click on the "Properties" tab and then click on "Static website hosting".

The screenshot shows the Amazon S3 console interface for a bucket named 'udacity-website'. The breadcrumb navigation at the top reads 'Amazon S3 > udacity-website'. Below this is a horizontal tab bar with four tabs: 'Overview', 'Properties' (which is the active tab), 'Permissions' (with a 'Public' label), and 'Management'. The main content area displays five configuration cards, each with a title, a brief description, a 'Learn more' link, and a 'Disabled' toggle switch. The cards are: 'Versioning' (Keep multiple versions of an object in the same bucket), 'Server access logging' (Set up access log records that provide details about access requests), 'Static website hosting' (Host a static website, which does not require server-side technologies), 'Object-level logging' (Record object-level API activity using), and 'Default encryption' (Automatically encrypt objects when). The 'Static website hosting' card is the one being focused on in the instructions.

Amazon S3 > udacity-website

Overview Properties Permissions Public Management

**Versioning**  
Keep multiple versions of an object in the same bucket.
